

Software Development Engineering Intern – Xeno

Location: Delhi / Hybrid / Remote | **Duration:** 12 months | **PPO** Upon successful completion

About Xeno

Xeno is an AI-native customer engagement platform — think agents-as-a-service for retail. We build autonomous AI agents that plan, personalize, and run engagement across every channel, spanning both AI-powered marketing automation and a full-stack loyalty platform that helps retailers turn one-time shoppers into repeat, high-value customers. Our agents handle everything from campaign orchestration to loyalty program design, rewards, and customer lifecycle management — all with minimal manual lift. We're trusted by industry leaders like Subway, FabIndia, Aditya Birla, Taco Bell, Harsha, and Lals Group. As digital retail surges, so does Xeno — and our agentic platform is at the core of how the next generation of omnichannel brands engage and retain their customers.

About the Internship

As a Software Development Engineering Intern, you'll be a core part of an AI-native Engineering team building products that create personalized experiences for millions. This is a true product engineer role — in line with the globally evolving definition of a software engineer who doesn't just write code, but owns outcomes end to end: shipping features, ensuring customer success, and driving real impact. You won't just code alongside AI — you'll help build the AI infrastructure and coding agents that power how Xeno ships. This is a hands-on, high-impact internship for folks who love clean code, move fast, and want to work at the frontier of agentic software development.

What You'll Do

- Build, test, and own AI-native product features end to end using Java or TypeScript
- Help improve Xeno's AI infrastructure and internal coding agents that accelerate the entire engineering team
- Work within an AI-native SDLC — using agentic tools and open harnesses to spec, build, review, and ship faster
- Build across both our marketing automation and loyalty platform, shaping how brands engage and retain customers
- Take features from idea to production and beyond — owning customer impact, not just code
- Debug, troubleshoot, and solve backend issues at scale
- Use tools like MySQL, MongoDB, Postman, LLMs, and generative AI to design and ship intelligent features
- Contribute to internal tools, AI-powered automation, and documentation
- Participate in hackathons, sprints, and team brainstorming

What We're Looking For

- Final year student or recent grad from a CS/IT/Software Engineering background
- Strong grip on Object-Oriented Programming, Data Structures, and Algorithms
- Proficient in Java or TypeScript
- Familiar with databases (SQL/NoSQL) and REST APIs
- Must have hands-on experience leveraging open harnesses (e.g. agentic coding tools / AI dev harnesses) to build products
- Hands-on or genuinely curious about LLMs, AI agents, and AI-native development workflows
- Product mindset — you care about the user and the impact, not just shipping the code
- Obsessed with writing clean, efficient & well-documented code
- You love solving problems and learning on the fly
- Team player with solid communication skills

What You'll Get

- Real-world experience building AI-native products at a fast-growing SaaS startup
- 1:1 mentorship from experienced engineers on an AI-native team
- Front-row exposure to agentic AI, modern AI infra, and an AI-native SDLC
- True ownership — work as a product engineer with real impact on customers and revenue
- Hands-on work with tech stacks used by top retail and D2C brands
- PPO opportunity upon successful completion
- A culture where learning, ownership & fun go hand-in-hand

If you love building things and want your code — and the agents you build — to make an impact, this is your cue. Apply now and let's build something awesome together
